CDKN2A (p14ARF) gene

Associated Syndrome Name: Melanoma cancer syndrome (MCS)

CDKN2A (p14ARF) Summary Cancer Risk Table

CANCER	GENETIC CANCER RISK	
Skin	High Risk	
Pancreatic	Elevated Risk	

CDKN2A (p14ARF) gene Overview

Melanoma cancer syndrome (MCS) 1, 2, 3, 4, 5

- Individuals with CDKN2A (p14ARF) mutations have melanoma cancer syndrome (MCS).
- Patients with MCS have a high risk of developing melanoma. There are currently no exact estimates of the risk associated with CDKN2A (p14ARF) mutations, but it is believed that melanoma risks are similar to those for patients with a similar condition due to mutations in the CDKN2A (p16INK4a) gene. Those risks are provided below. It is possible that these estimates will change over time as we learn more about the exact risks associated with mutations in CDKN2A (p14ARF).
- Patients with MCS due to mutations in CDKN2A (p14ARF) may also have a high risk for pancreatic cancer, as a high risk for pancreatic cancer has been observed in some families with mutations in the related gene CDKN2A (p16INK4a). Concern about pancreatic cancer risk should be higher for patients who have a family history of this cancer.
- Central nervous system tumors, particularly astrocytomas, have been reported in families with CDKN2A (p14ARF)
 mutations. However, further studies are needed to determine if these are conclusively associated with CDKN2A (p14ARF)
 gene mutations.
- Although there is a high risk for melanoma, and possibly pancreatic cancer, in patients with MCS, it may be possible to reduce this risk with appropriate medical management, including increased attention to surveillance and lifestyle modifications. Guidelines from expert groups for the management of patients with increased risks for these cancers are listed below. Since information about the cancer risks associated with CDKN2A (p14ARF) mutations is relatively new, and there is uncertainty about the best ways to reduce these risks, it may be appropriate to interpret these results in consultation with cancer genetics professionals who have expertise in this emerging area of knowledge.

CDKN2A (p14ARF) gene Cancer Risk Table

CANCER TYPE	AGE RANGE	CANCER RISK	RISK FOR GENERAL POPULATION
Melanoma	To age 50 ^{1, 5, 6, 7}	14%-50%	0.3%
	To age 80 ^{1, 5, 6, 7}	28%-76%	1.6%
Pancreatic	To age 75 ^{2, 4, 6, 7}	Elevated risk	0.8%

CDKN2A (p14ARF) Cancer Risk Management Table

The overview of medical management options provided is a summary of professional society guidelines. The most recent version of each guideline should be consulted for more detailed and up-to-date information before developing a treatment plan for a particular patient.

This overview is provided for informational purposes only and does not constitute a recommendation. While the medical society guidelines summarized herein provide important and useful information, medical management decisions for any particular patient should be made in consultation between that patient and his or her healthcare provider and may differ from society guidelines based on a complete understanding of the patient's personal medical history, surgeries and other treatments.

CANCER TYPE	PROCEDURE	AGE TO BEGIN	FREQUENCY (UNLESS OTHERWISE INDICATED BY FINDINGS)
Melanoma	Education about the importance of skin protection, such as sun avoidance, protective clothing and sunscreen. ^{8, 9}	Infancy	Ongoing

CANCER TYPE	PROCEDURE	AGE TO BEGIN	FREQUENCY (UNLESS OTHERWISE INDICATED BY FINDINGS)
	Whole-body skin examinations conducted by the patient or family member. ^{8, 9}	10 years	Monthly
Pancreatic	Comprehensive skin examination by a dermatologist, with total body photography and dermoscopy. ^{8, 9, 10}	10 years	Every 6 to 12 months
	Consider available options for pancreatic cancer screening, including endoscopic ultrasonography (EUS) and MRI/magnetic resonance cholangiopancreatography (MRCP). It is recommended that patients who are candidates for pancreatic cancer screening be managed by a multidisciplinary team with experience in screening for pancreatic cancer, preferably within research protocols. ¹¹	Age 40, or 10 years younger than the earliest age of pancreatic cancer diagnosis in the family	Annually
	Provide education about ways to reduce pancreatic cancer risk, such as not smoking and losing weight. ¹²	Individualized	Individualized

Information for Family Members

The following information for Family Members will appear as part of the MMT for a patient found to have a mutation in the CDKN2A (p14ARF) gene.

This patient's relatives are at risk for carrying the same mutation(s) and associated cancer risks as this patient. Cancer risks for females and males who have this/these mutation(s) are provided below.

Family members should talk to a healthcare provider about genetic testing. Close relatives such as parents, children, brothers and sisters have the highest chance of having the same mutation(s) as this patient. Other more distant relatives such as cousins, aunts, uncles, and grandparents also have a chance of carrying the same mutation(s). Testing of at-risk relatives can identify those family members with the same mutation(s) who may benefit from surveillance and early intervention.

Since there are screening and preventative measures recommended to begin in infancy or early childhood for individuals with CDKN2A (p14ARF) mutations, consideration should be given to the possibility of mutation testing at young ages.
